Since early explorations, biologists have been asking why South America has high biodiversity and how organisms got there during long periods of isolation. I address these questions of evolution using sheath-tailed bats (family Emballonuridae) as a study group. A molecular phylogeny was produced based on a phylogenetic analysis of DNA sequences from unlinked loci from the 4 components of genetic transmission found in mammals. Optimization of areas suggests that the ancestor of New World emballonurids had its origin in Africa. Divergence times were estimated with a relaxed clock approach and primary diversification in South America occurred during the Miocene. A study of historical biogeography indicated that the ancestral area was the Northern Amazon. Character mapping indicated a correlation of ear morphology with echolocation call design and foraging behaviour, which suggests a phylogenetic basis to the evolution of these character systems. These results will be of interest to biologists researching systematic biology, evolution, and biogeography. 144 pp. Englisch.
