Taking OP for initial line, let $POQ = 8$, $QOR = p$; then the sides of the triangle, and area S , can be immediately obtained. We require the average value then 12284. (R-Chartres.)-- BC is a fixed chord of a circle subtending an angle of 120 at the centre O : show that (1) for any position of A on the larger arc the ortho-centre, in-centre, circum-centre, Fermat's point, and another point Z of the triangle ABC lie on the arc BOC ; also find (2) Z , the isogonal conjugate of Z , and the value of $2(ZA)$. $2(ZA)$, without restricting A to the circle; and (3) the locus of the centre of the nine-point circle in (1), and, if the involute of this curve roll on a straight line, find the locus of the mid-point of BC . Solution by Professor Longchamps; the Proposer; and others. BC subtends at the ortho-centre, in-centre, circum-centre, Fermat's point F , and its isogonal conjugate Z , $180-A$, $90 + iA$, $2A$, 120 , and $A + 60$, each of which = 120 , if $A = 60$. By the similar triangles AZB , AKC , $ZA/c = 4/AK$, or $ZA \cdot s(FA) = 4e$; $-S(ZA) \cdot 2(FA) = 2(-4)$. Since the radius of the nine-point circle = $R = OD = \text{constant}$, therefore the locus of its centre is the circle having ODH for diameter. If the involute of this circle roll on a straight line LM , then LM equals sub-normal of the roulette described...
